VERDICT

The passenger compartment of the Audi Q5 remained stable in the frontal offset test. Dummy readings indicated good protection of the knees and femurs of both the driver and the front seat passenger. Audi showed that a similar level of protection would be provided to occupants of different sizes and to those sitting in different positions. Protection of the driver’s chest was rated as marginal, based on dummy readings of compression. Analysis of the deceleration of the impact trolley during the test, and analysis of the deformable barrier after the test, revealed that the Audi Q5 would be a very aggressive impact partner in a frontal collision. In the full-width rigid barrier test, protection of the chest of the rear passenger was marginal but protection was otherwise good or adequate. In the side barrier test, the Audi Q5 provided good protection to all critical body areas and scored maximum points. In the more severe side pole impact, protection was at least adequate for all critical body areas. Control of excursion (the extent to which a body is thrown to the other side of the vehicle when it is hit from the far side) was found to be adequate. The Audi Q5 has a countermeasure to mitigate against occupant-to-occupant injuries in such impacts. The airbag performed well in Euro NCAP’s tests

with dummy readings indicating good protection for both the driver and passenger. Tests on the front seats and head restraints demonstrated good protection against whiplash injuries in the event of a rear-end collision. The car has an advanced eCall system which alerts the emergency services in the event of a crash, and a system to prevent secondary impacts after the car has been in a collision. Audi demonstrated that the doors and windows would be openable to allow occupants to escape in the event of vehicle submergence. In the frontal offset test, protection of both the 6 year and 10 year dummies was good for all critical body areas. In the side barrier test, protection of the 10 year dummy was good or adequate for all critical body areas and good for the 6 year dummy. The front passenger airbag can be disabled to allow a rearward-facing child restraint to be used in that seating position. Clear information is provided to the driver regarding the status of the airbag and the system was rewarded. The AudiQ5 is equipped with an indirect 'child presence detection' system, which issues a warning when it recognises that a child or infant may have been left in the car. Indirect systems are no longer rewarded by Euro NCAP. All of the child restraint

types for which the Audi Q5 is designed could be properly installed and accommodated in the car. Protection of the head of a struck pedestrian or cyclist was predominantly adequate, with poor results recorded on the stiff windscreen pillars and at the base and top of the screen. Protection of the pelvis was mostly good. Protection of the femur was good at all test locations, while that of the knee and tibia was also good. The autonomous emergency braking system of the Audi Q5 responds to vulnerable road users such as pedestrians and cyclists, as well as to other vehicles. In tests of its response to pedestrians, the system performed adequately but does not react to those to the rear of the car. The system performed well in tests of its reaction to cyclists, but protection against ‘dooring’ is an option and was not assessed. The car’s response to motorcyclists was good. Overall, the performance of the autonomous emergency braking (AEB) system was good in tests of its reaction to other vehicles. A seatbelt reminder system is fitted as standard to the front and rear seats. The car has an indirect driver status monitoring system as standard, detecting driver fatigue but not distraction. The lane support system gently corrects the vehicle’s

path if it is drifting out of lane and also system identifies the local speed limit. limiter to be set automatically by the
intervenes in some more critical The driver can choose to allow the system.
